

VIEWING YOUR PROTOTYPE WITH ADOBE XD

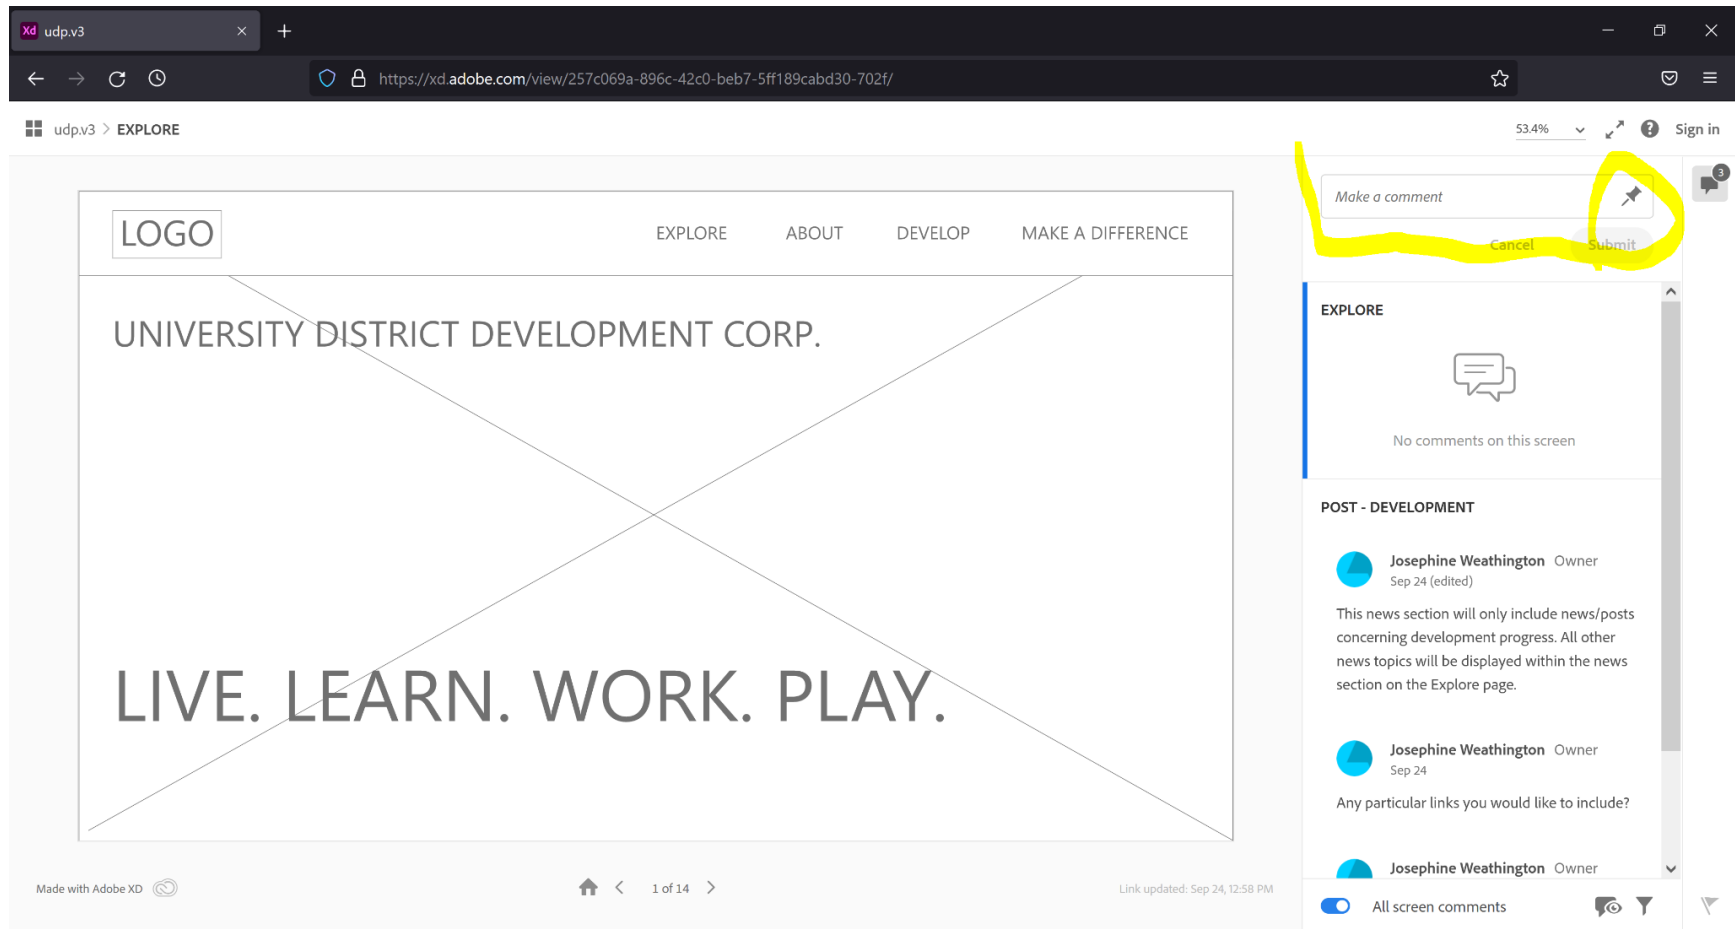

By District 3 Dev

Adobe XD is a way to access and experience the prototype of your website. You can click on each link to explore the prototype as you would a website or you can browse the pages individually by clicking on the arrows at the bottom.

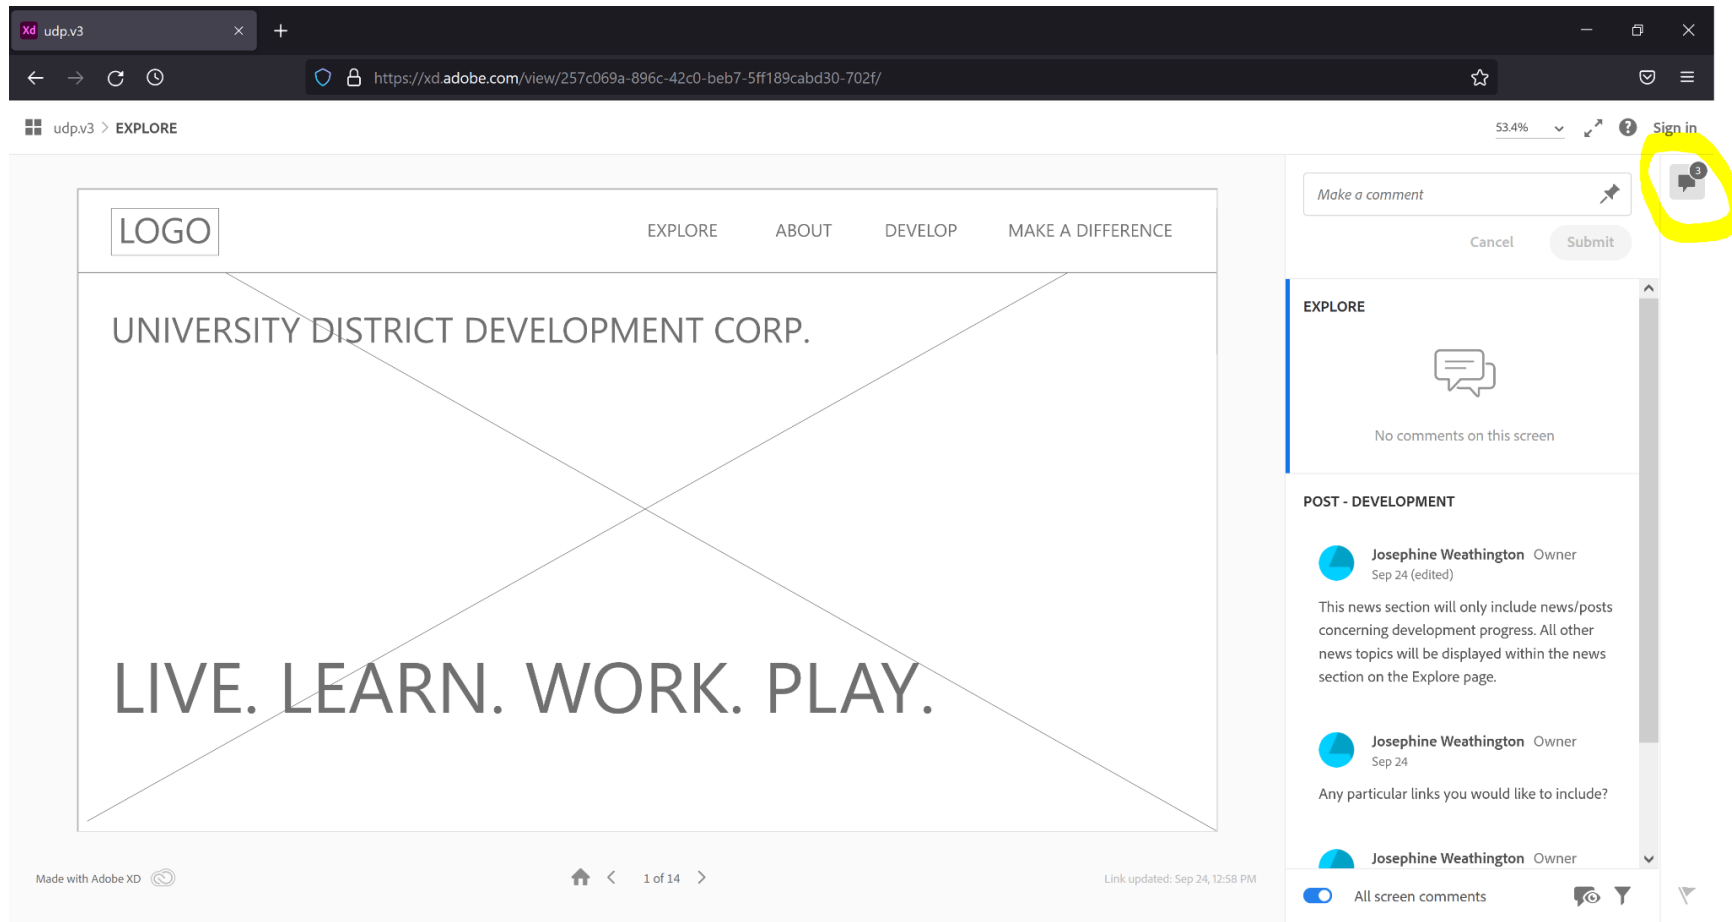

You can also provide quick feedback that is immediately sent to our development team.

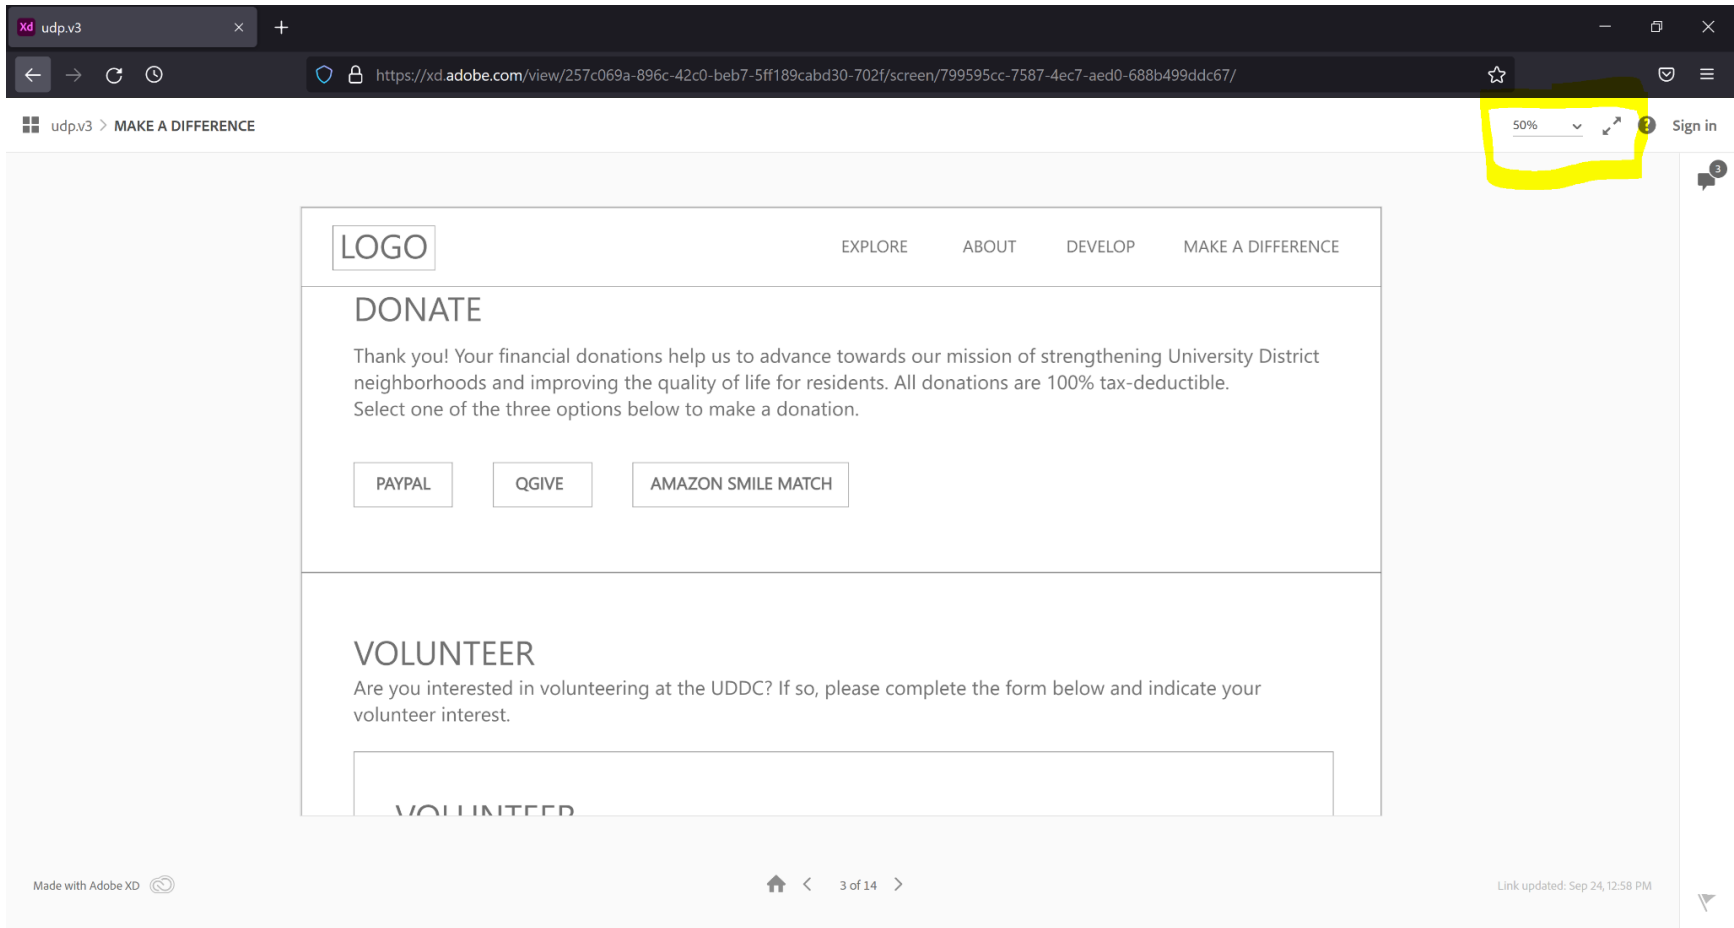

To leave a comment for a screen/webpage, simply begin typing in the “Make a Comment” dialog box. To leave a comment on a specific place on the screen, select the pin . This will give you a cursor to place the pin on the screen to give context to your comment. You will find that some screens already have comments pinned on certain sections of the page.

To hide all comments for a better viewing experience, click on the comment icon  on the far right, next to the “Make a comment” box.

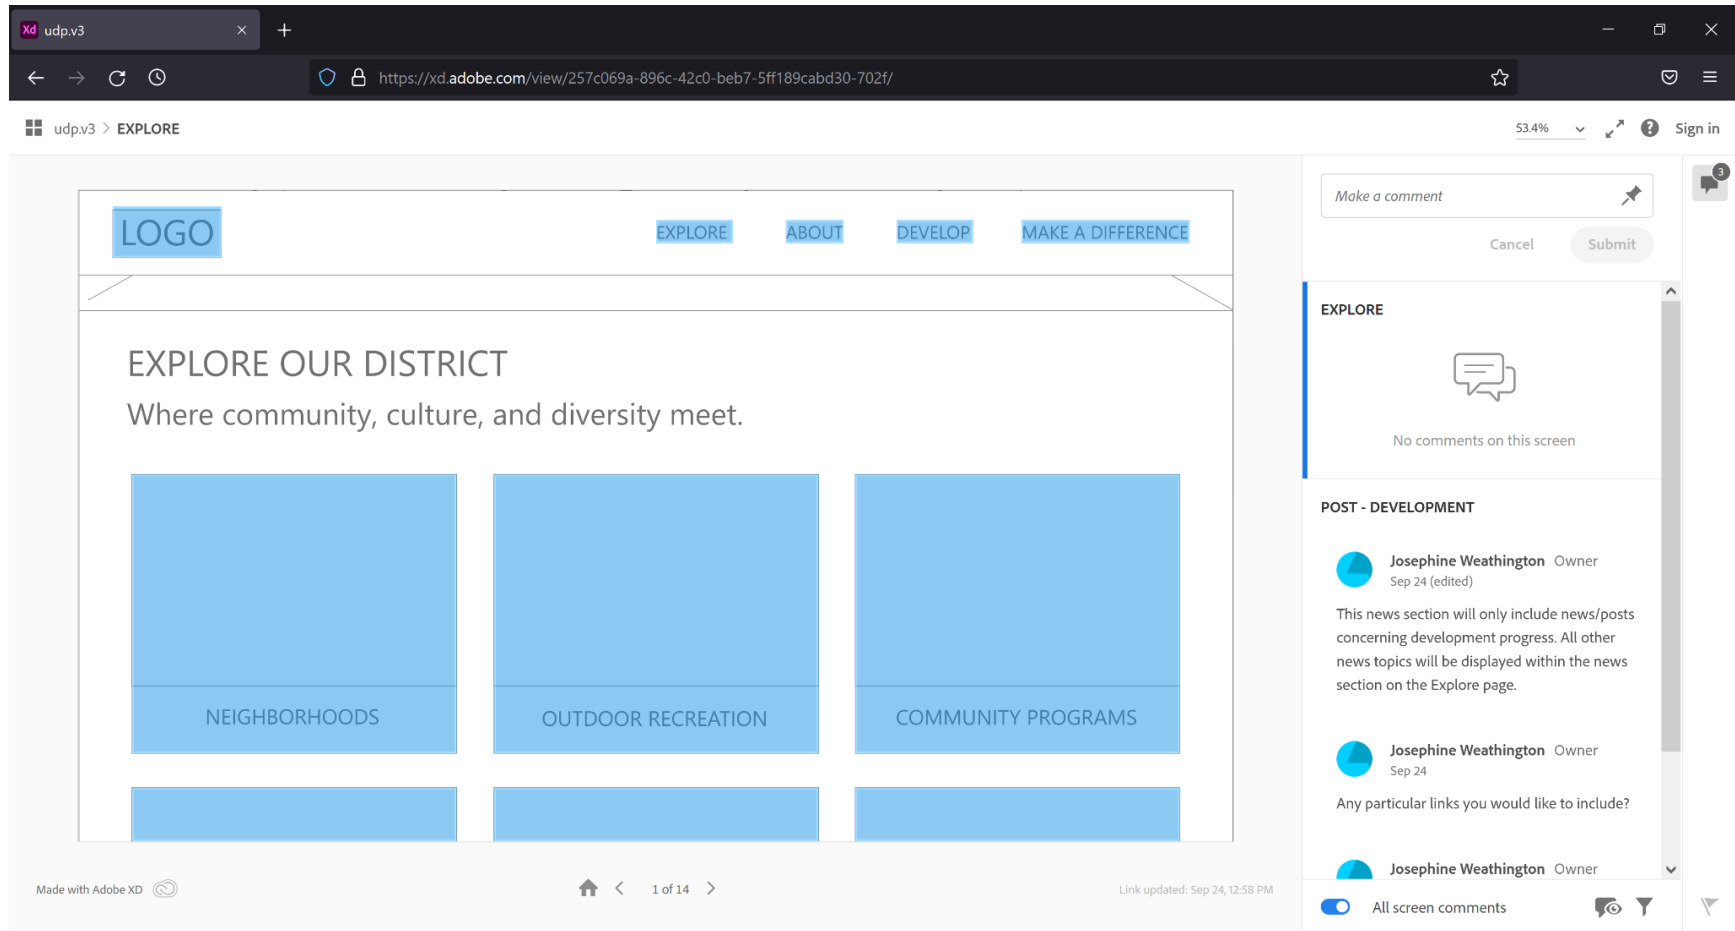

To zoom into the prototype, select the size by clicking the drop down menu on the far right.

Or set it to full width by selecting the up/down arrows, ↕

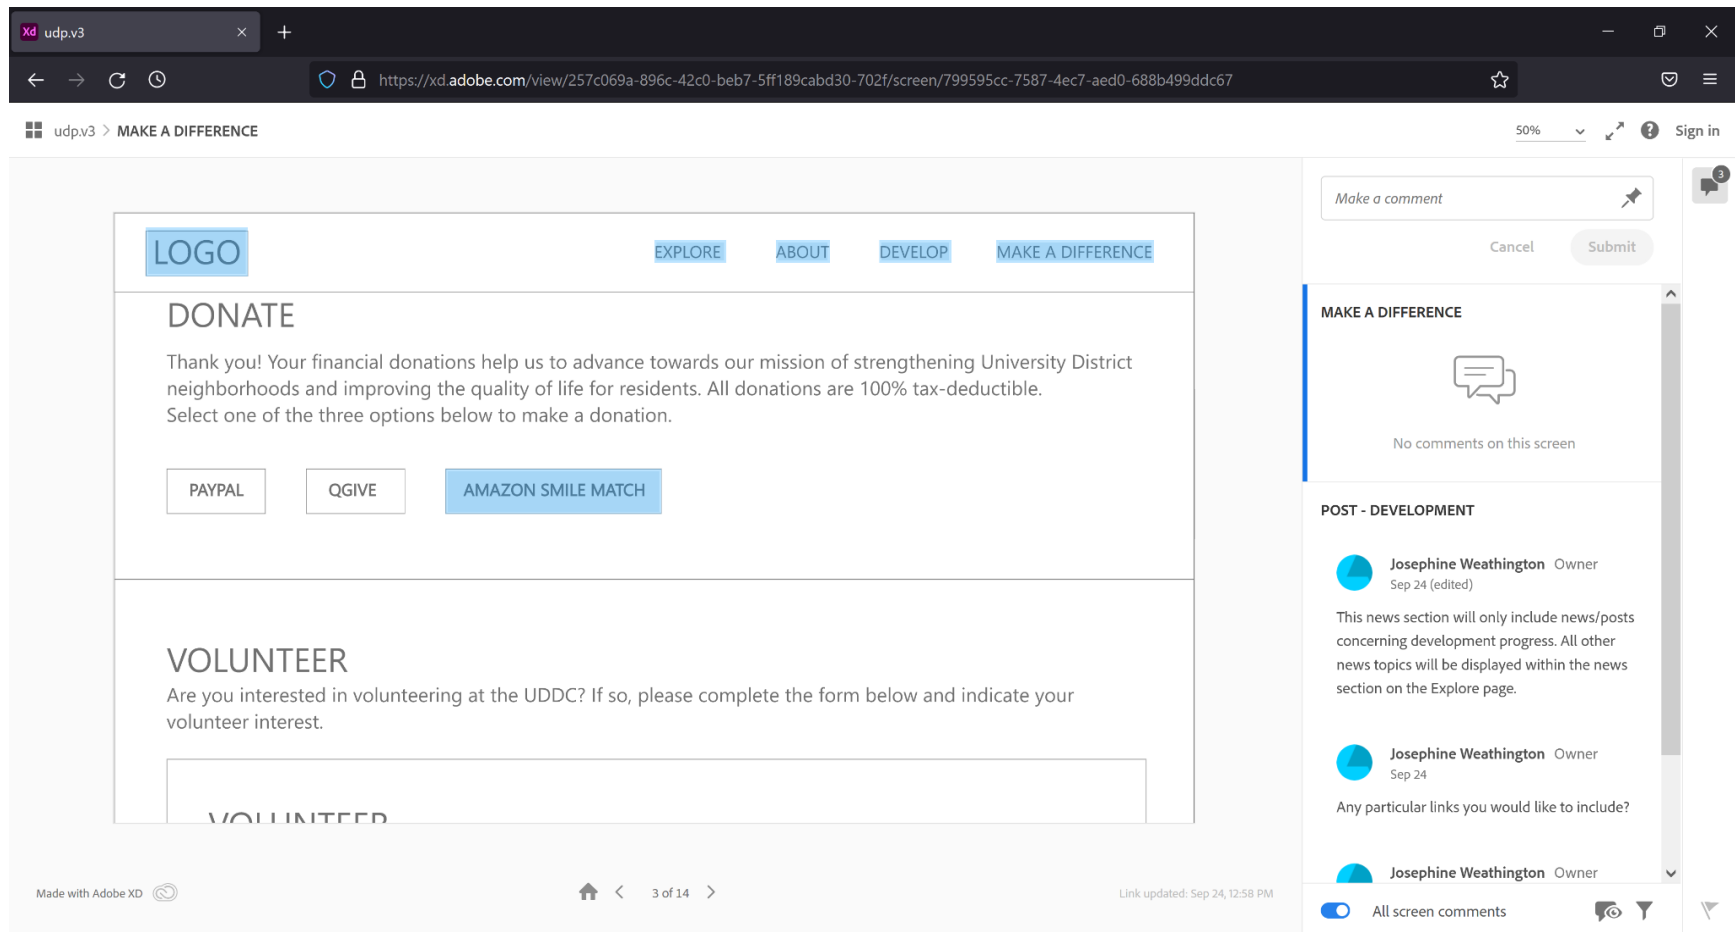

As you scroll through the prototype, you will see certain elements flash blue. These are called hotspot hints. Hotspot hints let you know what elements are clickable (take you to another page when clicked).

Just because an element is not clickable on the prototype, does not mean that it will not be clickable when we develop your website. For example, on the prototype, the PayPal and the QGive buttons are not clickable. We did not feel the need to design a prototype page for those payment forms because the

page will look similar to the current payment forms that you are using. However, the Amazon Smile Match button is clickable because we have redesigned how that page would look and how users will interact with it.

We hope you enjoy your experience reviewing your prototype and we look forward to receiving your feedback. Click the link to view your [PROTOTYPE](#).
